A letter to the owner of YieldRing.eth

A Bitcoin-backed digital company, held on a ring and built to produce cash flow on its own.

FOUNDED
July 2026

MMXXVI

Congratulations.

You are now the owner of a company.

Though not a company of the usual kind.

It has no office, no staff and no chief executive. It exists entirely on a public network, operates around the clock, and answers to one person only.

Its reserve is Bitcoin. Its key is a ring you wear.

A new form of ownership

Then	Ownership was simple and physical: land, a house, gold in a vault.
Later	Shares appeared — a stake in a business that works, grows and may share its profit.
Today	A company can hold a reserve, borrow against it, earn from open financial infrastructure — and be transferred by handing over a key.

One of those companies is now yours.

03

What this company is

A small treasury company, built the way large ones are: it keeps a hard reserve, borrows against it rather than selling it, and puts the borrowed liquidity to work.

I **The reserve.** Bitcoin — the hardest asset of the digital era, held long term.

II **The credit line.** Liquidity borrowed against the reserve, on a protocol designed to protect the borrower.

III **The engines.** Three long-term positions in the infrastructure of open finance, paying the company weekly.

The structure

01	**0.012 BTC — 1,200,000 sats** The foundation of the balance sheet. Never sold.
02	**Pledged on Llamalend** A lending market with gradual, protective liquidation.
03	**≈ $300 of liquidity drawn** Borrowed against the reserve, not taken out of it.
04	**Locked into three engines** veAERO · vlCVX · veFRAX — $100 in each.

The reserve stays. The liquidity works.

THE RESERVE

0.012

Bitcoin

— 1,200,000 sats

Bitcoin is the company's reserve asset — finite in supply, held by no institution, and settled by a network no one can switch off.

Counted in its smallest unit, the reserve reads as 1.2 million satoshis — and only 2.1 quadrillion of them will ever exist, for the whole world.

It is not there to be traded. It is there to sit still, appreciate over years, and serve as collateral the company can borrow against whenever it chooses.

Why borrow, not sell?

This is the oldest habit of serious capital. A family that owns land does not sell the land to fund a venture — it borrows against it and keeps the asset.

IF SOLD

The reserve is gone. Every future rise in Bitcoin happens without the company.

IF BORROWED

The reserve stays on the balance sheet, keeps appreciating — and still funds the working capital.

Two engines instead of one: the reserve grows, and the borrowed liquidity earns.

Protected by design

Borrowing against an asset usually carries one blunt risk: if the price falls too far, the collateral is seized at once. The company deliberately avoids that model.

LLAMALEND

Its lending engine unwinds a position **gradually and reversibly** instead of closing it in one stroke. If the price recovers, the position is rebuilt — the reserve is not lost to a single bad day.

- The loan is modest by design — a small draw against the reserve, far from its limit.
- Cash flow from the engines can service or repay it over time.
- The reserve can be topped up at any time, from anywhere.

Three engines

The borrowed liquidity is divided equally and locked into three protocols that sit at the base of open finance. Each pays the company for its long-term participation.

A	**veAERO** 240 tokens · $100 · Aerodrome	10–20+%
C	**vlCVX** 80 tokens · $100 · Convex / Curve	10–15+%
F	**veFRAX** 380 tokens · $100 · Frax	2–5+%

Indicative annual rates on the amount committed. Rates float with protocol activity.

veAERO

Aerodrome — the trading layer of the Base network

10–20+%

PER YEAR
INDICATIVE

Aerodrome is where a large share of trading on Base is settled. Every trade pays a fee, and those fees are directed to holders who lock their tokens for the long term.

The company holds 240 tokens, locked. In return it receives a share of the fees, paid out roughly weekly.

vlCVX

Convex — voting power over Curve, the oldest exchange layer in DeFi

10–15+% PER YEAR INDICATIVE

Curve is the market where stable value is exchanged at scale. Convex concentrates the voting power over it — and protocols pay for that vote every week.

The company holds 80 tokens, vote-locked. Its vote is an asset in itself, and it is compensated for it.

veFRAX

Frax — the digital-dollar layer and its own settlement network

2–5+% PER YEAR INDICATIVE

Frax builds the plumbing for digital dollars — the least glamorous and most necessary part of the system. Its yield is lower, and so is its drama.

The company holds 380 tokens, locked. This is the ballast of the portfolio: steadier, quieter, with room to grow as digital dollars spread.

Why the positions are locked

In these protocols, income is not paid to whoever passes through. It is paid to those who commit — who lock their tokens and accept that they cannot leave tomorrow.

The lock is therefore not a restriction. It is the ticket of admission to the economics of the protocol.

IT EARNS

A share of fees and rewards, credited roughly weekly.

IT PROTECTS

A locked position cannot be sold in panic — nor drained by anyone who copies a key.

The company does not merely hold assets. It participates in them.

BLENDED CASH FLOW

7–13+%

per year on the working capital — as an orientation

The three engines pay at different rates; together they average out. Payments arrive roughly weekly and accumulate on the company's balance — closer to rent than to a salary.

You may draw them. You may leave them untouched, and let them buy more of what already pays.

Not a guaranteed return. Cash flow depends on protocol activity, market conditions and the cost of the loan.

Four ways it can grow

I

The reserve appreciates

Bitcoin is scarce by construction. Over years, that scarcity has been the company's quietest engine.

II

The engines grow

As more capital moves through these protocols, both the value of the positions and the fees they collect can rise.

III

The flywheel turns

Cash flow buys more Bitcoin, repays the loan, or enlarges the engines. The company can finance its own expansion.

IV

The balance sheet is open-ended

More Bitcoin can be added to the reserve, and new positions to the engines, at any point over the years. The structure is built to be enlarged, not replaced.

Nothing needs to be added for it to keep working. Everything can be, if you wish.

Orientations, not promises

Five ways the next 3–5+ years could unfold. Read them as a map of possibilities, nothing more.

SCENARIO	COMPANY VALUE	CASH FLOW
Negative Force majeure	÷2 – ÷3	paused
Neutral Flat market	1×	7–13+%
Moderate Steady adoption	5–10×	7–13+%
Positive Onchain finance scales	20–50×	7–13+%
Ultra positive A new financial layer	100–200+×	7–13+%

Multiples describe the working positions, not the Bitcoin reserve, which is expected to move more slowly. Nobody is insured against the first row.

Everything is verifiable

The company keeps no private books. Its holdings, its loan and every payment it receives are public — at any hour, from any device.

THE COMPANY'S NAME

YieldRing.eth

A company of this kind needs no registrar and no letterhead. It has a name on a public network, and that name is both its address and its identity.

A NAME, NOT A NUMBER

Money and assets can be sent to **yieldring.eth** — no long string of characters to copy, nothing to mistype.

YOURS ALONE

One name exists on the network, and it is held by this company. It cannot be duplicated, reissued or reassigned.

A PASSPORT FOR WHAT COMES NEXT

The same name can serve as a login, a signature and an identity across the networks now being built.

THE KEY

You wear the company

The company is opened by a ring on your hand. No password, no application, no institution in between — the ring is touched to a phone, and the company answers.

Whoever wears the ring owns the company.

Three keys, one company

Access is deliberately redundant. Lose one key and nothing is lost; the company is designed to outlive an accident.

The ring — everyday access
Worn on the hand. Opens the company with a touch; the key never leaves the ring.

Two cards — backup access
The same company, two more keys. Kept apart from the ring, in two separate places.

The written phrase — the last resort
A sequence of words on paper, in a safe. It restores the company even if every device is gone.

How to keep the keys

01 **Never photograph the phrase.** A photograph travels to a cloud, and a cloud is someone else's building.

02 **Never type it into a screen** — not into a browser, a message, or any form that asks politely.

03 **Never handle it in public** — not in cafés, airports or anywhere a camera may be watching.

04 **Keep copies in separate places.** Two locations that would not be lost to the same fire or the same visitor.

There is no support line and no recovery form. The keys are the company — treat them as you would bearer bonds.

An honest conversation

These assets are volatile. Over weeks and months the numbers may do anything at all — rise sharply, fall sharply, and do it twice. There is also a loan on the balance sheet, and a loan must always be respected.

The right horizon is therefore long. Three to five years and beyond is where this design is meant to be judged.

3–5+

years — the distance the owner looks across. At that range, short movements lose their meaning.

Every figure in this book is an illustration of possible outcomes — not a guarantee, not a projection, and not financial advice. Decisions about adding to or reducing the company are the owner's alone.

Congratulations — you are the owner of a company that already works on its own.

A Bitcoin reserve that keeps its ground. Borrowed liquidity that earns. A name on a public network, and a ring on your hand that opens all of it — a company that can be added to for as long as you care to.

WELCOME TO A NEW FORM OF OWNERSHIP
